Structure Angular applications with Modules

Alex Thalhammer

Goal

- Learn how to structure an Angular application with Modules
- Know how to use them in your projects

Current AppModule

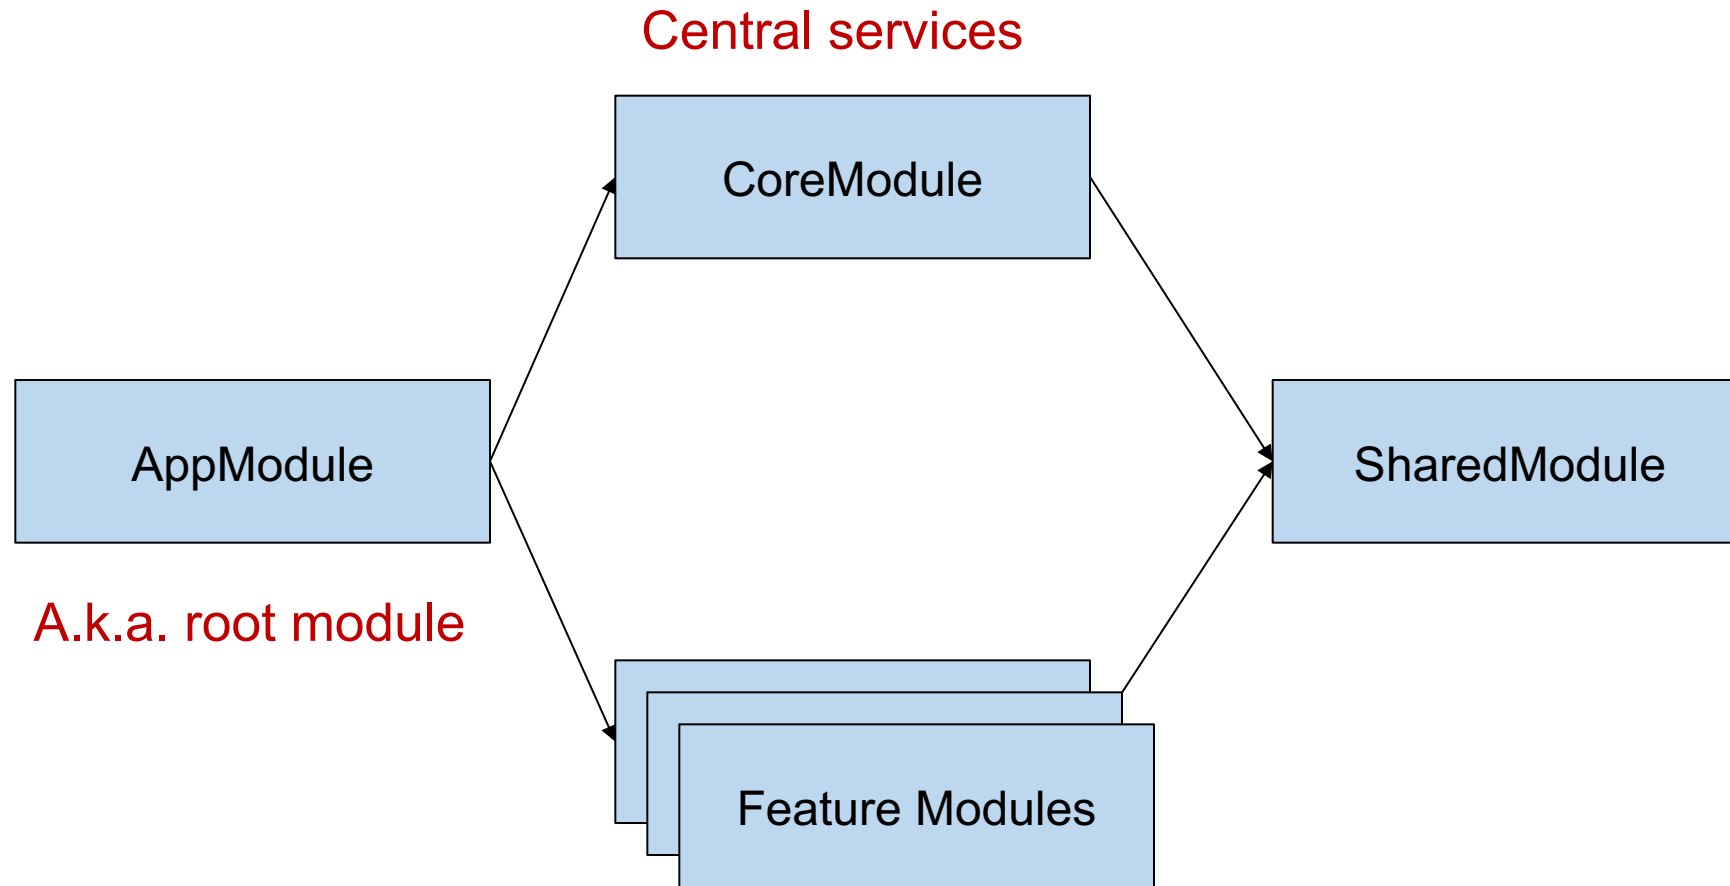

```
@NgModule({  
  imports: [  
    BrowserModule, HttpClientModule, FormsModule  
  ],  
  declarations: [  
    AppComponent,  
    FlightSearchComponent,  
    CityPipe  
  ],  
  bootstrap: [  
    AppComponent  
  ]  
})  
export class AppModule {}
```

Typical module structure

Optional: CoreModule

SharedModule

```
@NgModule({  
  imports: [  
    CommonModule  
  ],  
  declarations: [  
    CityPipe  
  ],  
  exports: [  
    CityPipe  
  ]  
})  
export class SharedModule {}
```

-----> declarations have to be exported to be used in other Modules!

FlightBookingModule (Feature Module)

```
@NgModule({
  imports: [
    CommonModule, FormsModule, SharedModule
  ],
  declarations: [
    FlightSearchComponent
  ],
  providers: [
    FlightService
  ],
  exports: [
    FlightSearchComponent
  ]
})
export class FlightBookingModule {}
```

----- Provider for this module exclusively
(Angular <= 5 way of providing Services)

----- Everything we want to use in other modules!

AppModule (Root Module)

```
@NgModule({  
  imports: [  
    BrowserModule, HttpClientModule, FlightBookingModule  
  ],  
  declarations: [  
    AppComponent  
  ],  
  bootstrap: [  
    AppComponent  
  ]  
})  
export class AppModule {}
```

Re-exporting of modules

```
@NgModule({  
  imports: [  
    CommonModule, FormsModule  
  ],  
  declarations: [  
    CityPipe  
  ],  
  exports: [  
    CityPipe, FormsModule  
  ]  
})  
export class SharedModule {}
```

Use it here and in the modules that import this module
